

Thrombosis

Elsa Bianchini, MCU hématologie pharmacie
elsa.bianchini@universite-paris-saclay.fr

Thrombosis : physiopathology

Thrombus = bleeding cessation

Physiological hemostasis

- Primary hemostasis = Platelet plug
- Coagulation = Fibrin network

Thrombosis : physiopathology

Thrombus = bleeding cessation

Physiological hemostasis

- Primary hemostasis = Platelet plug
- Coagulation = Fibrin network

Thrombus = blood flow obstruction ⇒ hypoperfusion ⇒ ischemia

Pathological thrombosis

- Primary hemostasis = Platelet plug
- Coagulation = Fibrin network

Thrombosis : physiopathology

Thrombus = bleeding cessation

Physiological hemostasis

- Primary hemostasis = Platelet plug
- Coagulation = Fibrin network

Thrombus = blood flow obstruction ⇒ hypoperfusion ⇒ ischemia

Pathological thrombosis

- Primary ~~X~~ hemostasis = Platelet plug
Antiplatelet drugs
- Coagulation ~~X~~ = Fibrin network
Anticoagulant drugs

Thrombosis : physiopathology

Arterial thrombosis
Damaged vessel wall: Atherosclerosis
High shear forces
Platelet-rich thrombus
↓
Antiplatelet drugs

Venous thrombosis
Not associated with atherosclerosis
Low shear forces
Fibrin-rich thrombus
↓
Anticoagulant drugs

Thrombosis : diagnosis

Physical exam

- **Medical history/Clinical context**
- Visible signs of thrombosis (swelling, tissue or temperature changes)
- Heart pulse, blood pressure

Imaging tests

- X-rays of blood vessels (angiogram or venogram)
- Ultrasound (Doppler)
- Magnetic resonance imaging (MRI).

Blood tests

- Platelets count
- D-Dimer

Arterial thrombosis

Venous thrombosis

Thrombosis : diagnosis

Physical exam

- Medical history/Clinical context
- visible signs of thrombosis (swelling, tissue or temperature changes)
- Heart pulse, blood pressure

Imaging tests

- X-rays of blood vessels (angiogram or venogram)
- Ultrasound (Doppler)
- Magnetic resonance imaging (MRI).

Blood tests

- Platelets count
- D-Dimer

Arterial thrombosis

Venous thrombosis

Venous thrombosis

venous thromboembolic disease (VTE)

Proximal DVT

Symptoms :

- Leg swelling
- Leg pain, cramping or soreness that often starts in the calf
- Change in skin color on the leg (red or purple)
- A feeling of warmth on the affected leg

Distal DVT

Deep vein thrombosis (DVT)

Venous thrombosis

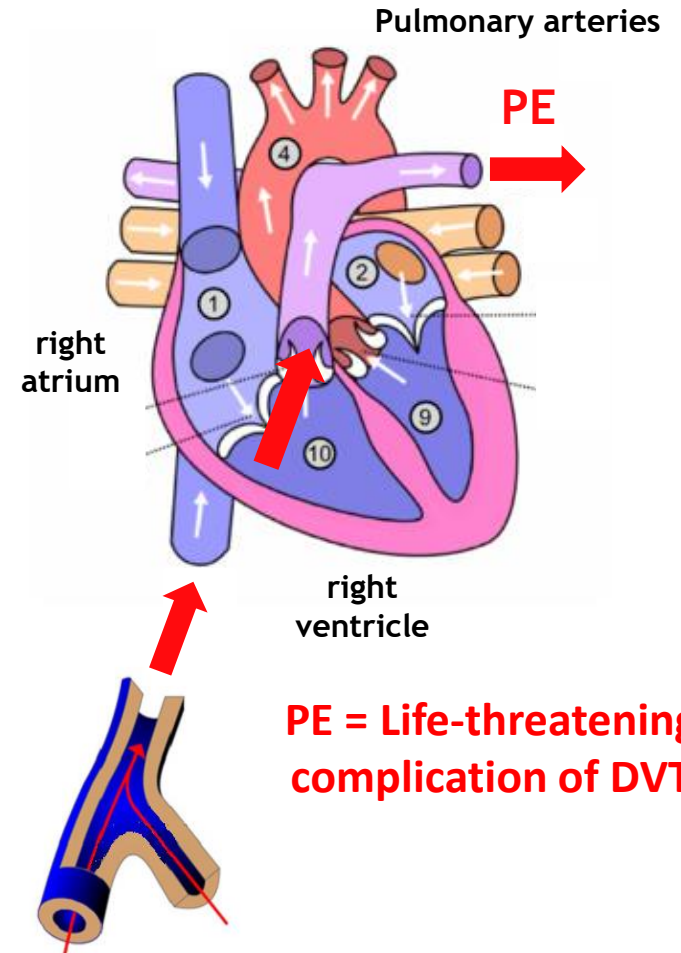

venous thromboembolic disease (VTE)

Deep vein thrombosis (DVT)

Proximal DVT

Distal DVT

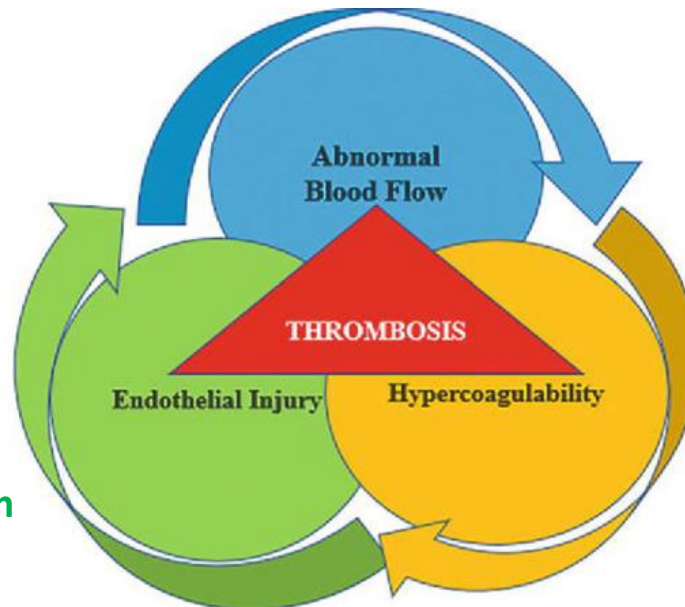

Pulmonary embolism (PE)

Venous thrombosis

Dilated vein ⇨ Damaged/deformed Valves
Aging
Immobilization
Compression

⇨ **Blood stasis**

Anticoagulant factor deficiency
(AT, PC, PS, TFPI)
Excess of procoagulant factors
(FV Leiden, FII G20210A)
Antiphospholipids syndrom

⇨ **Hypercoagulability**

Surgery, trauma
Cancer, inflammation
Oxidative stress (aging, smoking,
obesity, ...)

⇨ **Alteration of the endothelium**

Virchow's triad (first described by Dr Virchow in 1858, and still relevant!)

Venous thrombosis

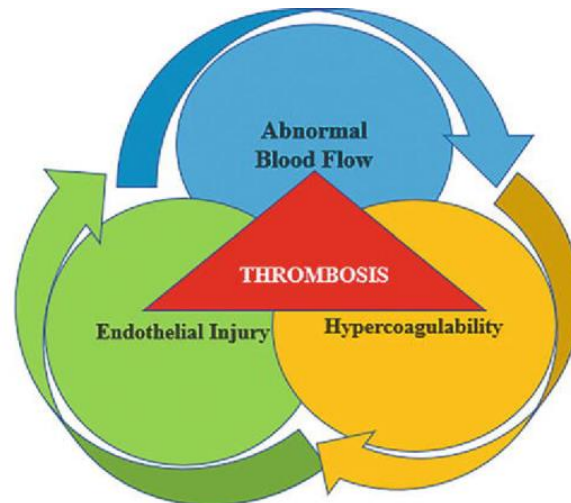

Risk Factors for Thromboembolism disease

Acquired

- Surgery
- Age
- Immobilization
 - Travel
 - Hospitalization
 -
- Obesity
- Cancer
- Pregnancy
- Hormonal treatment
-

Genetic

- Deficit in AT, PC, PS
- FV Leiden
- FII Mutation

Venous thrombosis

Risk Factors for Thromboembolism disease

Acquired

- Surgery
- Age
- Immobilization
 - Travel
 - Hospitalization
 -
- Obesity
- Cancer
- Pregnancy
- Hormonal treatment
-

Genetic

- Deficit in AT, PC, PS
- FV Leiden
- FII Mutation

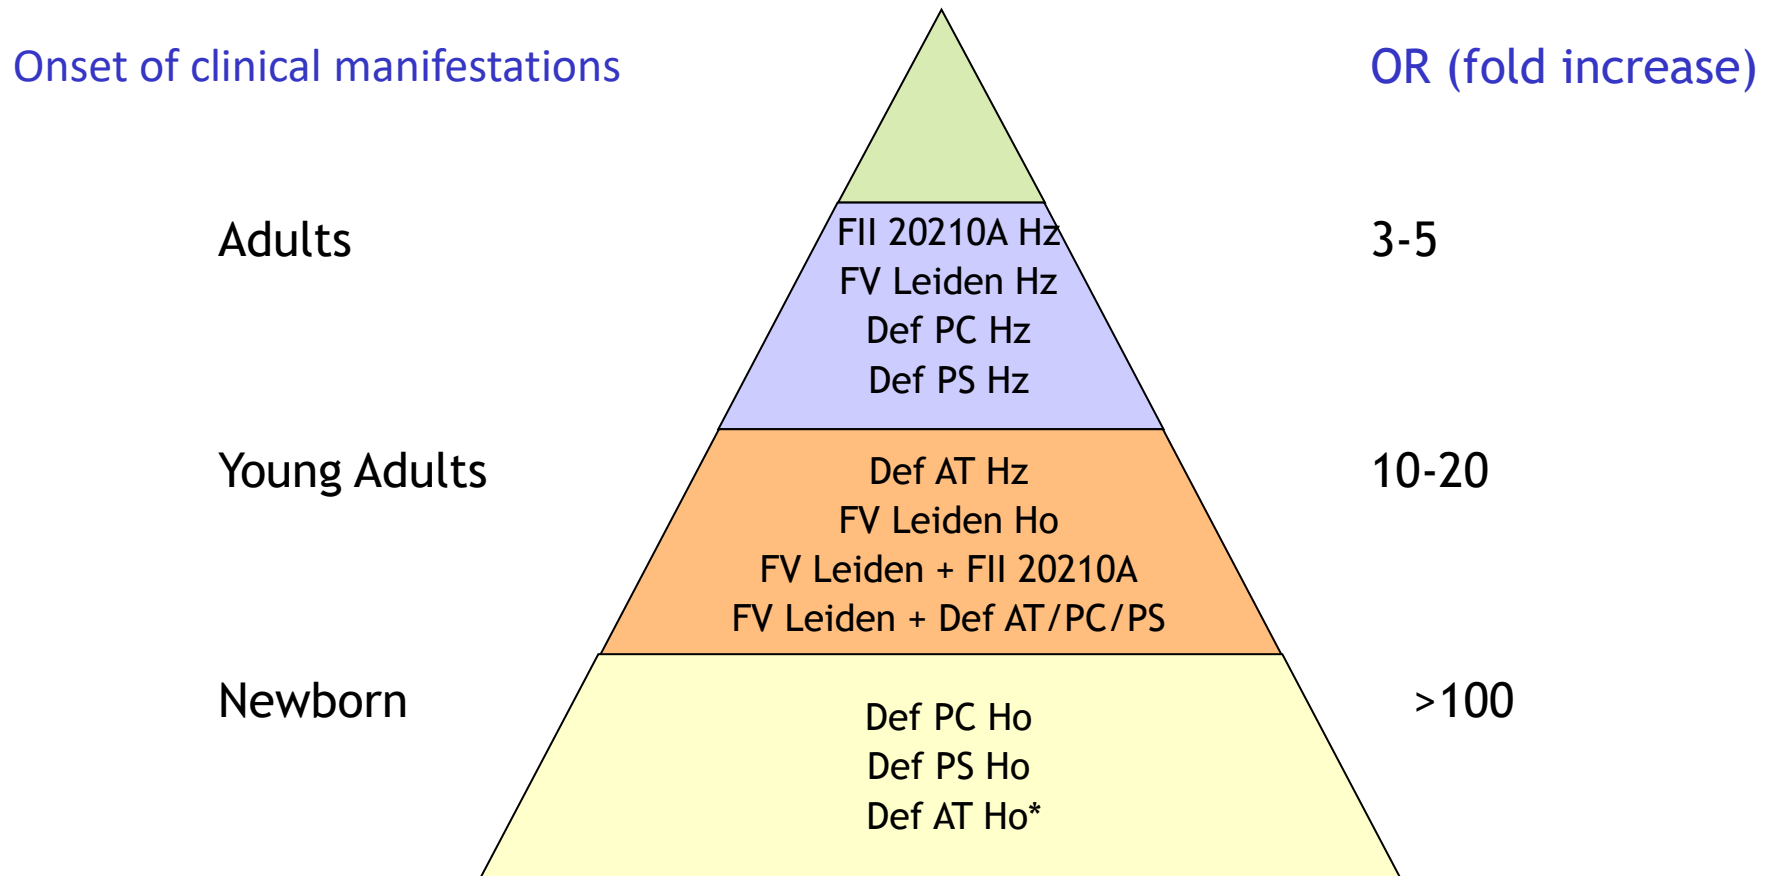

Examples:

Casts of the lower limbs
Orthopedic Surgery
Immobilization
Long travel

Odd ratio **36**
OR **16**
OR **7**
OR **1.6**

Venous thrombosis

Risk associated with biological thrombophilia

DVT diagnosis

Clinical score for DVT

Table 2. Simplified Clinical Model for Assessment of Deep Vein Thrombosis*

Clinical Variable	Score
Active cancer (treatment ongoing or within previous 6 months or palliative)	1
Paralysis, paresis, or recent plaster immobilization of the lower extremities	1
Recently bedridden for 3 days or more, or major surgery within the previous 12 weeks requiring general or regional anesthesia	1
Localized tenderness along the distribution of the deep venous system	1
Entire leg swelling	1
Calf swelling at least 3 cm larger than that on the asymptomatic leg (measured 10 cm below the tibial tuberosity)†	1
Pitting edema confined to the symptomatic leg	1
Collateral superficial veins (nonvaricose)	1
Previously documented DVT	1
Alternative diagnosis at least as likely as DVT	-2
Weak Probability	≤ 0
Moderate Probability	1-2
High Probability	≥ 3

DVT diagnosis

Clinical score for DVT

Evaluation of DVT clinical probability (Score)

High

Venous echo-Doppler

No DVT

DVT

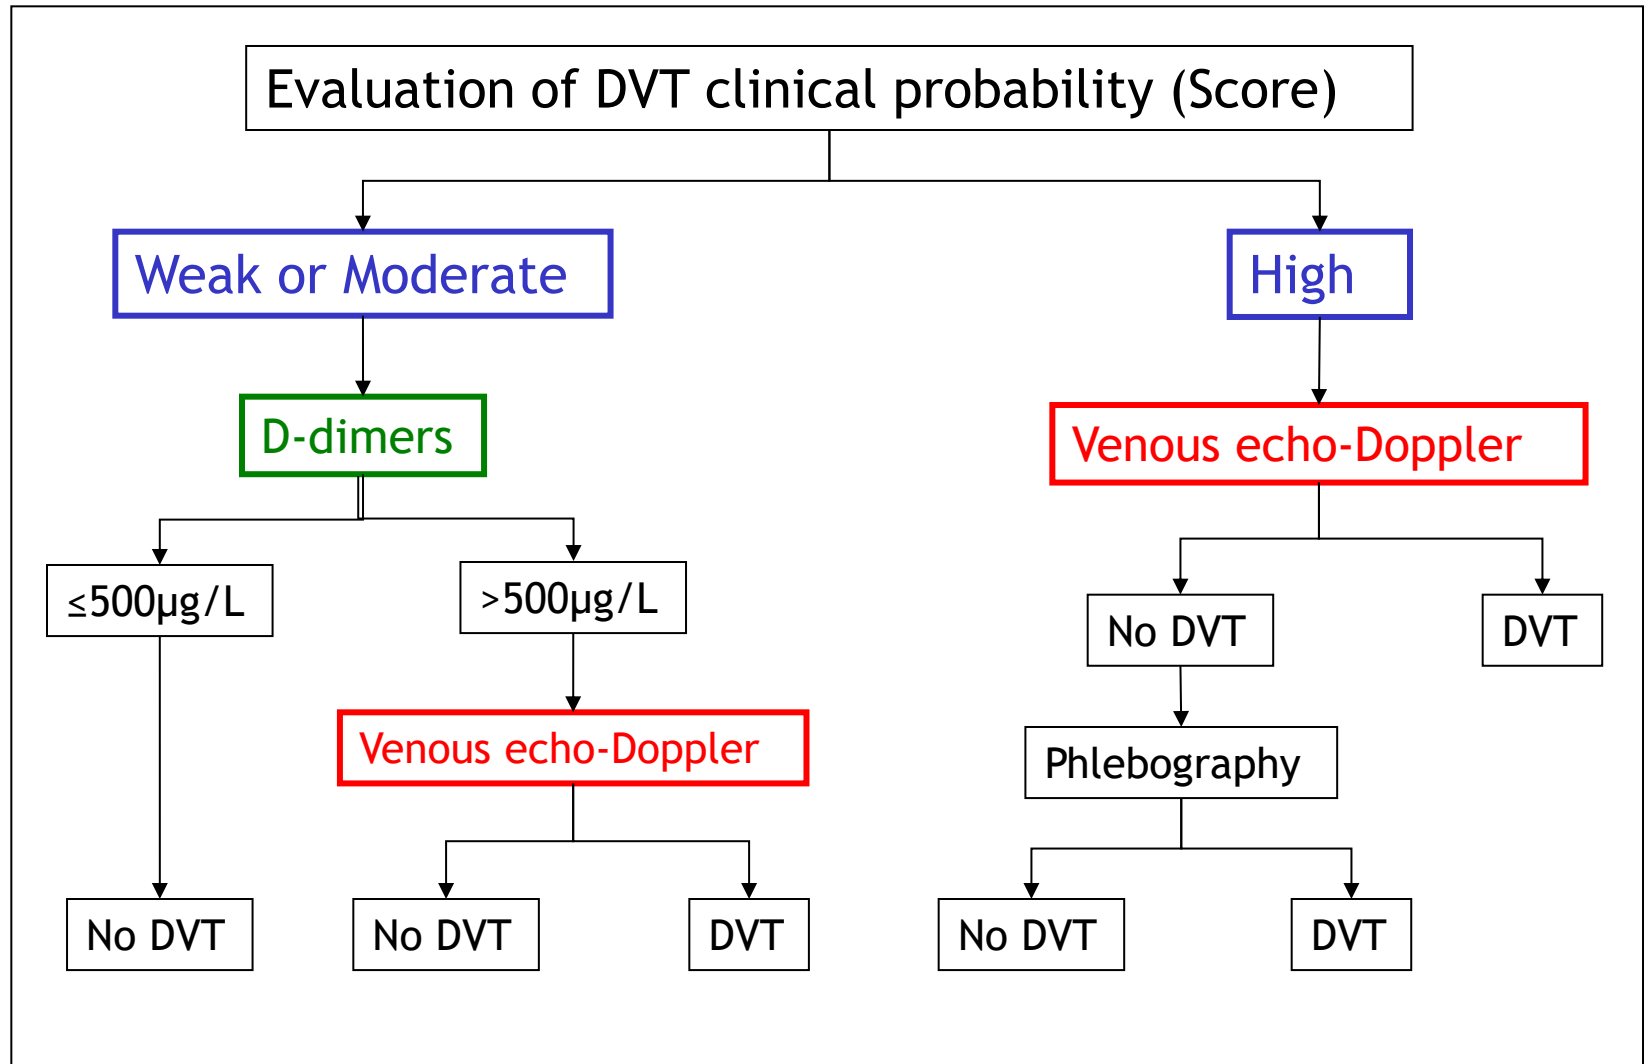

Phlebography

No DVT

DVT

DVT diagnosis

Clinical score for DVT

DVT diagnosis

When must we search for biological thrombophilia?

-
- Thrombosis in **young subjects** (< 45 years)
 - **Recurrent** Thrombosis
 - Thrombosis of **unusual localization**
-
- In particular if the DVT is **spontaneous**
-
- **Family history** of DVT
-

DVT treatments

Anticoagulants to act on coagulation !

They don't "remove" an existing clot, but they can prevent it from growing

PE may require thrombolytic therapy (fibrinolysis)

Emergency treatment for life-threatening PE

3 therapeutic classes :

Heparins (IV or SC)

VKA = Vitamin K Antagonists (oral)

DOAC = Direct Oral AntiCoagulants (oral)

Anticoagulants

Anticoagulants

Heparins (IV or SC)

Sulfated polysaccharides

Bind to Antithrombin

Potentiate its anti-FIIa/FXa activity

Unfractionated heparin (UFH)

Long chains

Mean MW = 14-18 kD

Low molecular weight heparin (LMWH)

Shorter chains

Mean MW ~ 4 kD

Fondaparinux (Arixtra®)

The shortest chain able to bind AT

MW = 1,7 kD

Animal products

Chemical product

Anticoagulants

Heparins : mechanism of action

Active site

Arg 393

NH⁺

SO₃⁻

Several ionic interactions

Anticoagulants

Heparins : mechanism of action

Active site

Arg 393

Active site exposure

Anticoagulants

Heparins : mechanism of action

Increased reactivity toward FXa
Interaction 300-fold faster

No effect on FIIa/AT interaction
Allosteric activation is not sufficient to
accelerate FIIa-AT complex formation

Allosteric mechanism

Anticoagulants

Heparins : mechanism of action

Ila

AT

Increased reactivity toward FXa
Interaction 600-fold faster
Only 2-fold faster than with short chain

Increased reactivity toward FXa
Interaction 4,000-fold faster

Allosteric + bridging mechanism

Anticoagulants

Heparins (IV or SC)

Sulfated polysaccharides

Bind to Antithrombin

Potentiate its anti-FIIa/Fxa activity

Unfractionated heparin (UFH)

Long chains

Mean MW = 14-18 kD

Low molecular weigh heparin (LMWH)

Shorter chains

Mean MW ~ 4 kD

Fondaparinux (Arixtra®)

The shortest chain able to bind AT

MW = 1,7 kD

Both anti-FXa and FIIa effect

Mainly anti-FXa effect

Only anti-FXa effect

Anticoagulants

Heparins (IV or SC)

	UFH	LMWH	Fondaparinux
$t_{1/2}$	Short 1-2 hrs	4 hrs	15h
Biodisponibility	Low ~ 10% High interindividual variability	> 90% Low interindividual variability	100% No interindividual variability
Monitoring	APTT mandatory	Not required only if renal failure, extreme weight, hemorrhage	Not required only if renal failure, extreme weight, hemorrhage
Elimination	Cellular + kidney	Mainly kidney	Kidney only
Limitation	Heparin-induced thrombocytopenia	Heparin-induced thrombocytopenia	No antidote !

Anticoagulants

VKA = Vitamin K antagonists (oral route)

Vit K required for functional Gla domain synthesis

VKA impair synthesis of vit K-dependent factors

Anticoagulants

VKA = Vitamin K antagonists (oral route)

Vit K required for functional Gla domain synthesis

VKA impair synthesis of vit K-dependent factors

Coumarins (warfarin, acenocoumarol) + fludion

Delay of action (due to their mechanism of action) = 3-4 days

CYP-dependent complex metabolism ⇒ several food and drug interactions

High interindividual variability

Monitoring required = INR (international normalized ratio PT patient/PT normal plasma)

Target INR (DVT or PE prevention) = 2-3.

If INR < 2 inadequate prevention. If > 3 bleeding risk !!

Reversal = Vit K-dpdt factor concentrate / Vit K

Anticoagulants

DOAC = Direct Oral AntiCoagulants (oral route)

Direct reversible and competitive enzyme inhibitors

Anticoagulants

DOAC = Direct Oral AntiCoagulants (oral route)

Direct reversible and competitive enzyme inhibitors

Dabigatran (Pradaxa®) ⇒ target FIIa

Rivaroxaban (Xarelto®)

Apixaban (Eliquis®)

Edoxaban (Lixiana®)

⇒ target FXa

“Xaban”

Anticoagulants

DOAC = Direct Oral AntiCoagulants (oral route)

Direct reversible and competitive enzyme inhibitors

Dabigatran (Pradaxa®) ⇨ target FIIa

Rivaroxaban (Xarelto®)
Apixaban (Eliquis®)
Edoxaban (Lixiana®) } ⇨ target FXa “Xaban”

Many assets over VKA, more and more prescribed

Short delay of action ($t_{\max} \sim 3$ hrs)

Very few food and drug interactions

Low interindividual variability

But same risk of bleeding events

Renal elimination

No monitoring (except specific situations, renal failure, hemorrhage, invasive surgery)

INR not suitable for DOAC, anti-FXa or anti-FIIa activity

Anticoagulants

Need for a reversal agent

DOAC = Direct Oral AntiCoagulants (oral route)

Direct reversible and competitive enzyme inhibitors

Dabigatran (Pradaxa®) ⇨ target FIIa

Idarucizumab (Paxbind®)

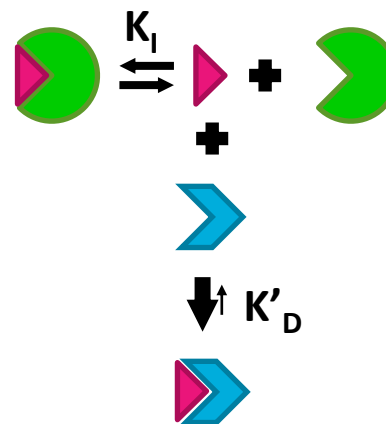

Humanized mAb, that diverts dabigatran from FIIa binding

K'_D for dabigatran ~2,1 pM

K_i (IIa/Dabigatran) ~ 4,5 nM

Almost irreversible !

Anticoagulants

Need for a reversal agent

DOAC = Direct Oral AntiCoagulants (oral route)

Direct reversible and competitive enzyme inhibitors

Dabigatran (Pradaxa®) ⇒ target FIIa

Rivaroxaban (Xarelto®)

Apixaban (Eliquis®)

Edoxaban (Lixiana®)

⇒ target FXa = “Xaban”

Idarucizumab (Paxbind®)

Andexanet-alpha (Ondexxya®)

Recombinant inactive gla domain-less FXa

Anticoagulants

Indication	Drug
DVT/PE acute phase	Heparin or DOAC
DVT/PE prevention (depends on clinical context)	DOAC (or AVK) if long term Heparin if short term
Stroke prevention in patients with atrial fibrillation (AF)	Long term DOAC (VKA if ongoing treatment)
Kidney failure requiring dialysis	Heparin

Thrombosis : diagnosis

Physical exam

- Medical history/Clinical context
- visible signs of thrombosis (swelling, tissue or temperature changes)
- Heart pulse, blood pressure

Imaging tests

- X-rays of blood vessels (angiogram or venogram)
- Ultrasound (Doppler)
- Magnetic resonance imaging (MRI).

Blood tests

- Platelets count
- D-Dimer

Arterial thrombosis

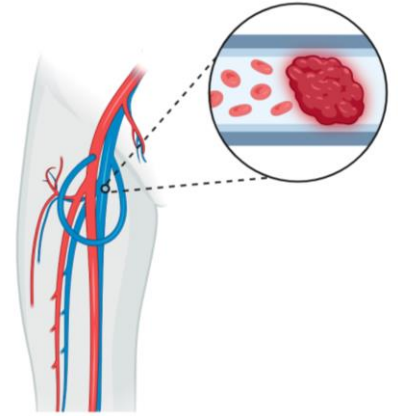

Venous thrombosis

Arterial thrombosis

Coronary arteries
=
Myocardial infarction (MI)

leg arteries
=
Limb ischemia
Peripheral Artery
Disease (PAD)

Brain arteries
=
Ischemic Stroke

Arterial thrombosis : treatment

Thrombolytic therapy (fibrinolysis)

Emergency treatment for heart attacks, strokes,...

Thrombectomy

Emergency treatment for heart attacks, strokes,...

Percutaneous coronary intervention (PCI)

Emergency treatment for Myocardial infarction

Arterial thrombosis : treatment

Its mandatory to prevent recurrence

Atherosclerotic context

Antiplatelet drugs

3 targets

COX-1

P2Y12

GPIIb/IIIa

Arterial thrombosis
Damaged vessel wall: Atherosclerosis

High shear forces
Platelet-rich thrombus

Antiplatelet drugs

Primary hemostasis

Platelet activation = 3 steps process

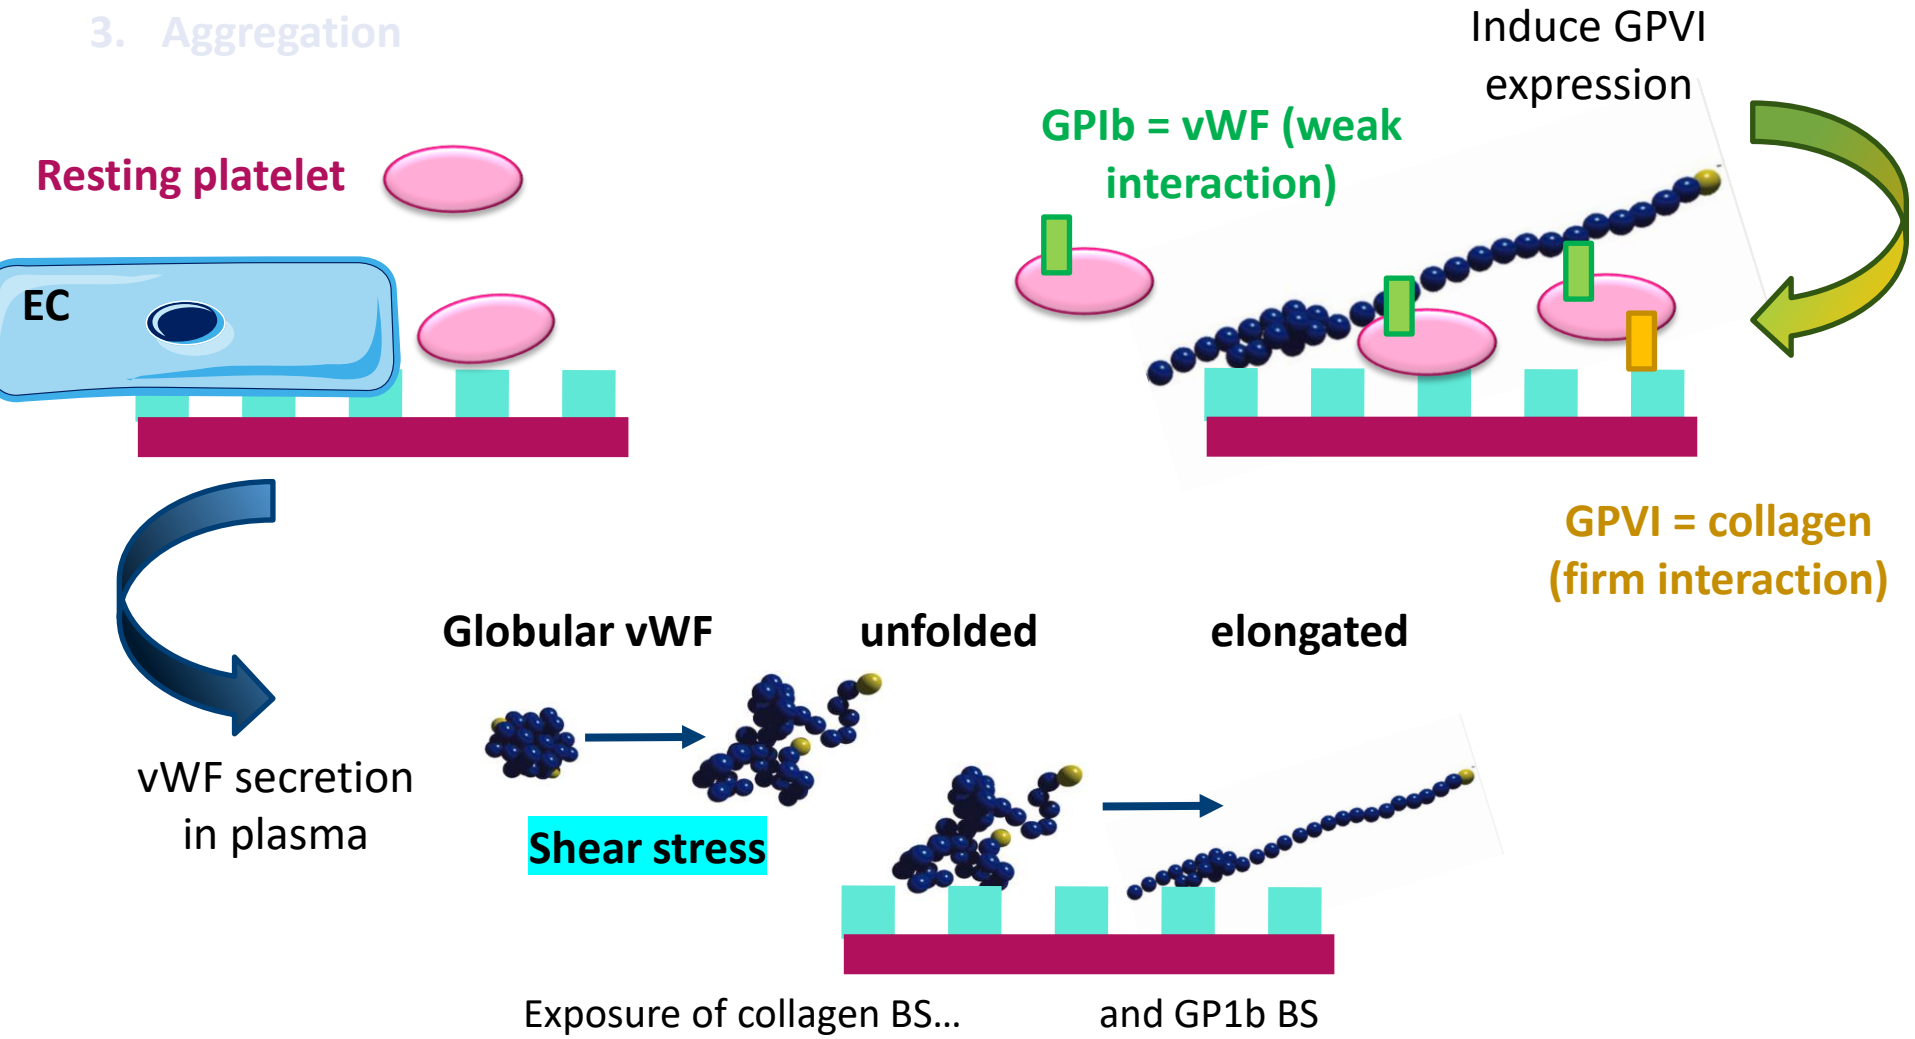

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion)
3. Aggregation

Primary hemostasis

Platelet activation = 3 steps process

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion)
3. Aggregation

Primary hemostasis

Platelet activation = 3 steps process

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion) = Outside-in signaling
3. Aggregation

① Actin remodeling

Flat shape

Round shape
Pseudopods

② Granule secretion

α -granule

vWF
Fibrinogen
PF4

Dense granule

ADP
Serotonin
 Ca^{2+}

Primary hemostasis

Platelet activation = 3 steps process

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion) = Outside-in signaling
3. Aggregation

Signaling pathway

② Granule secretion

α -granule

- vWF
- Fibrinogen
- PF4

Dense granule

- ADP
- Serotonin
- Ca²⁺

Primary hemostasis

In the same time...

Platelet activation = 3 steps process

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion)
3. Aggregation

③ Flip-Flop

- PS exposure
- Procoagulant surface

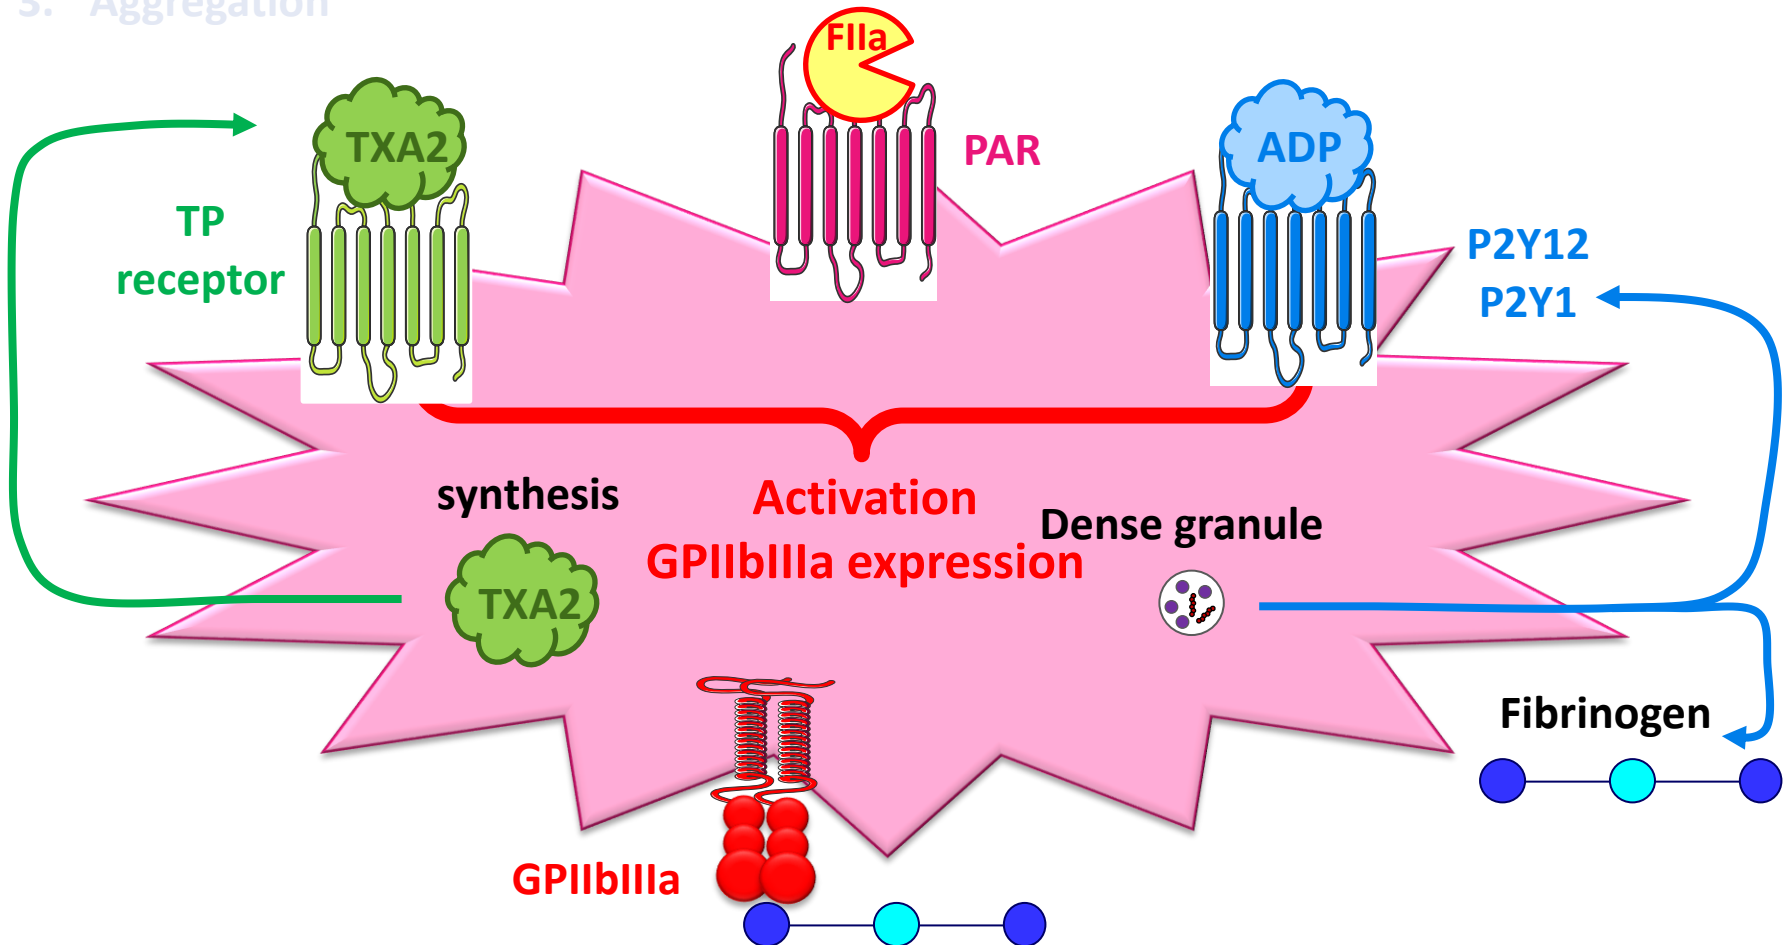

④ Thromboxane A2 (TXA2) secretion

Primary hemostasis

Platelet activation = 3 steps process

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion)
3. Aggregation

Primary hemostasis

Platelet activation = 3 steps process

1. Adhesion
2. Activation (cytoskeleton remodeling, secretion)
3. **Aggregation**

GPIIb/IIIa/fibrinogen complexes
bridge activated platelets

Arterial thrombosis : treatment

Its mandatory to prevent recurrence

Atherosclerotic context

Antiplatelet drugs

3 targets

COX-1 (Activation pw TXA2)

P2Y12 (Activation pw ADP)

GPIIb/IIIa (pt aggregation)

Arterial thrombosis
Damaged vessel wall: Atherosclerosis

High shear forces
Platelet-rich thrombus

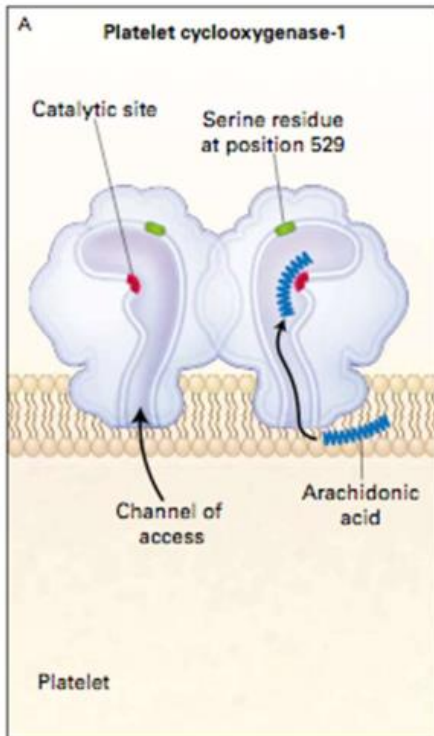

Antiplatelet drugs

Antiplatelet drugs

Aspirin (Acetyl-salicylic acid) = COX inhibitor

- Irreversible inhibitor of platelet COX-1
 - Persisting effect for platelet lifetime (10 days)
 - Antiplatelet effect obtained with low doses (50-100 mg/day)
- Acetylation of Serine 529
 - Away from the catalytic site

From Catella-Lawson, *N Engl J Med*, 2001

➤ TXA2 secretion ⇌

➤ platelet activation

Antiplatelet drugs

Aspirin (Acetyl-salicylic acid) = COX inhibitor

- Name and registered in 1899 by Bayer
- Meta-analysis of more than 100 studies (antithrombotic trialists' collaboration, BMJ 2002)

Reduces cardiovascular mortality by 15%

Reduces nonfatal cardiovascular events by 30 %

- Gastrointestinal adverse effects

Abdominal pain, nausea

Ulcers, perforations ⇨ Gastrointestinal bleeding

Direct caustic effect (acidity) + antiplatelet effect (bleeding risk)

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

Several drugs available

- ~~Ticlopidine (Ticlid[®]), discontinued (thrombopenia, neutropenia, anemia)~~
- Clopidogrel (Plavix[®])
- Prasugrel (Efient[®]/Effient[®])
- Ticagrelor (Brilique[®], Brilinta[®])
- Cangrelor (Kengrexal[®], Kengreal[®])

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

	Clopidogrel*	Prasugrel	Ticagrelor	Cangrelor
Approved	1997	2009	2011	2015
Receptor blockage	irreversible	irreversible	reversible	reversible
Route of adm	oral	oral	oral	IV
Prodrug	Yes	Yes	No	No
Metabolism	CYP dependent, 2 steps	CYP dependent, 1 step	Liver	No
Onset of effect	2-8 hrs	0,5-4 hrs	0,5-2 hrs	Immediate
Inhibition of platelet agreg	40–62%	70%	80–90%	>90%
Effect lasts for	7-10 days	7-10 days	3-5days	1 hr

* Numerous drug interactions and resistance, High interindividual variability

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

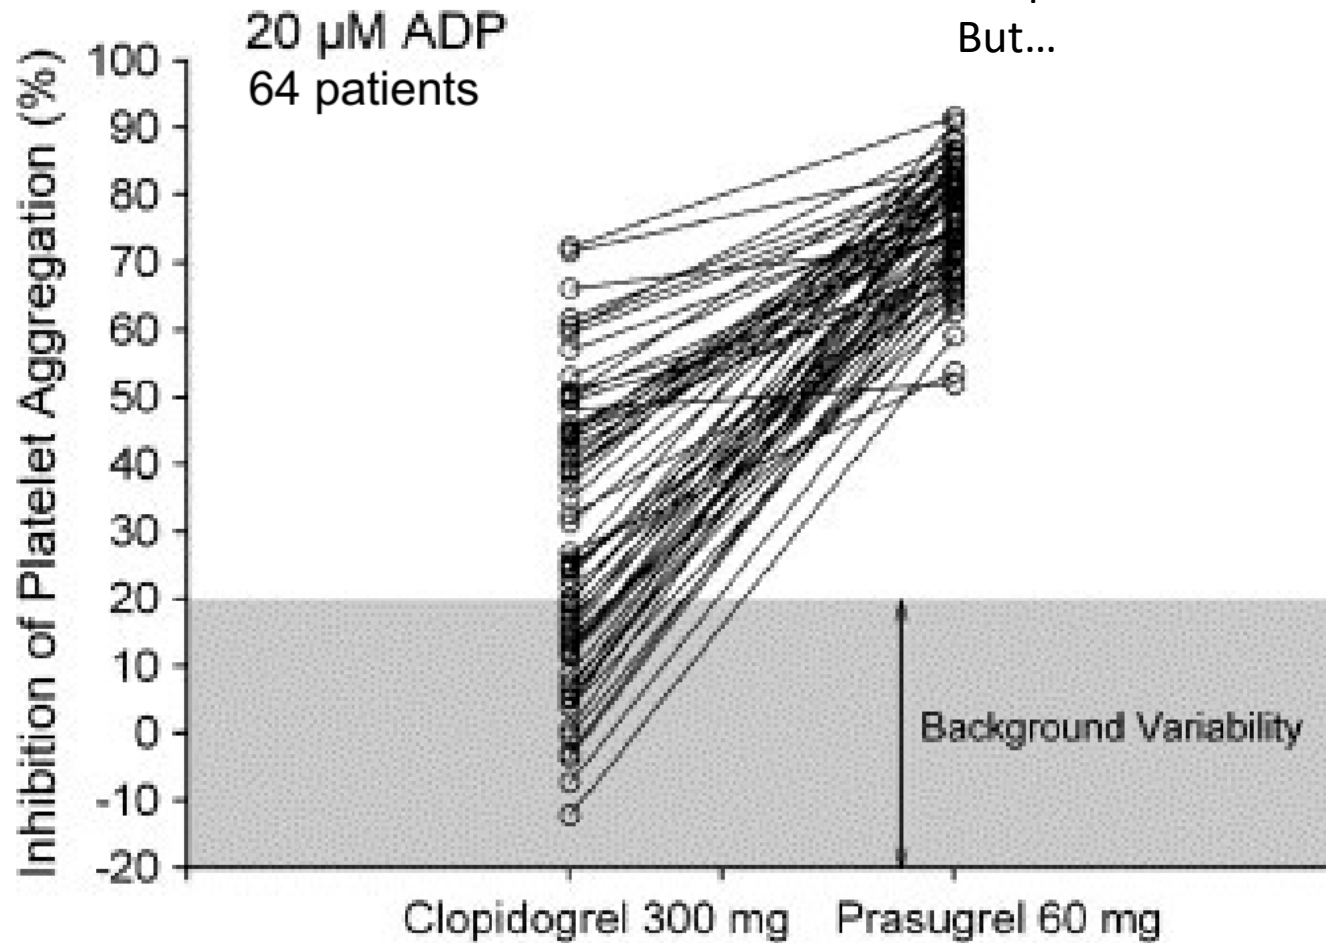

- Less used (IV route)
- Not clearly superior to prasugrel and ticagrelor
- Approved for patients undergoing PCI, transition to an oral P2Y12 inhibitor after procedure

	Cangrelor
Approved	2015
Receptor blockage	reversible
Route of adm	IV
Prodrug	No
Metabolism	No
Onset of effect	Immediate
Inhibition of platelet agreg	>90%
Effect lasts for	1 hr

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

Prasugrel \searrow interindividual variability
Simpler metabolism
But...

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

Prasugrel more powerful, but slightly less safe than clopidogrel

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

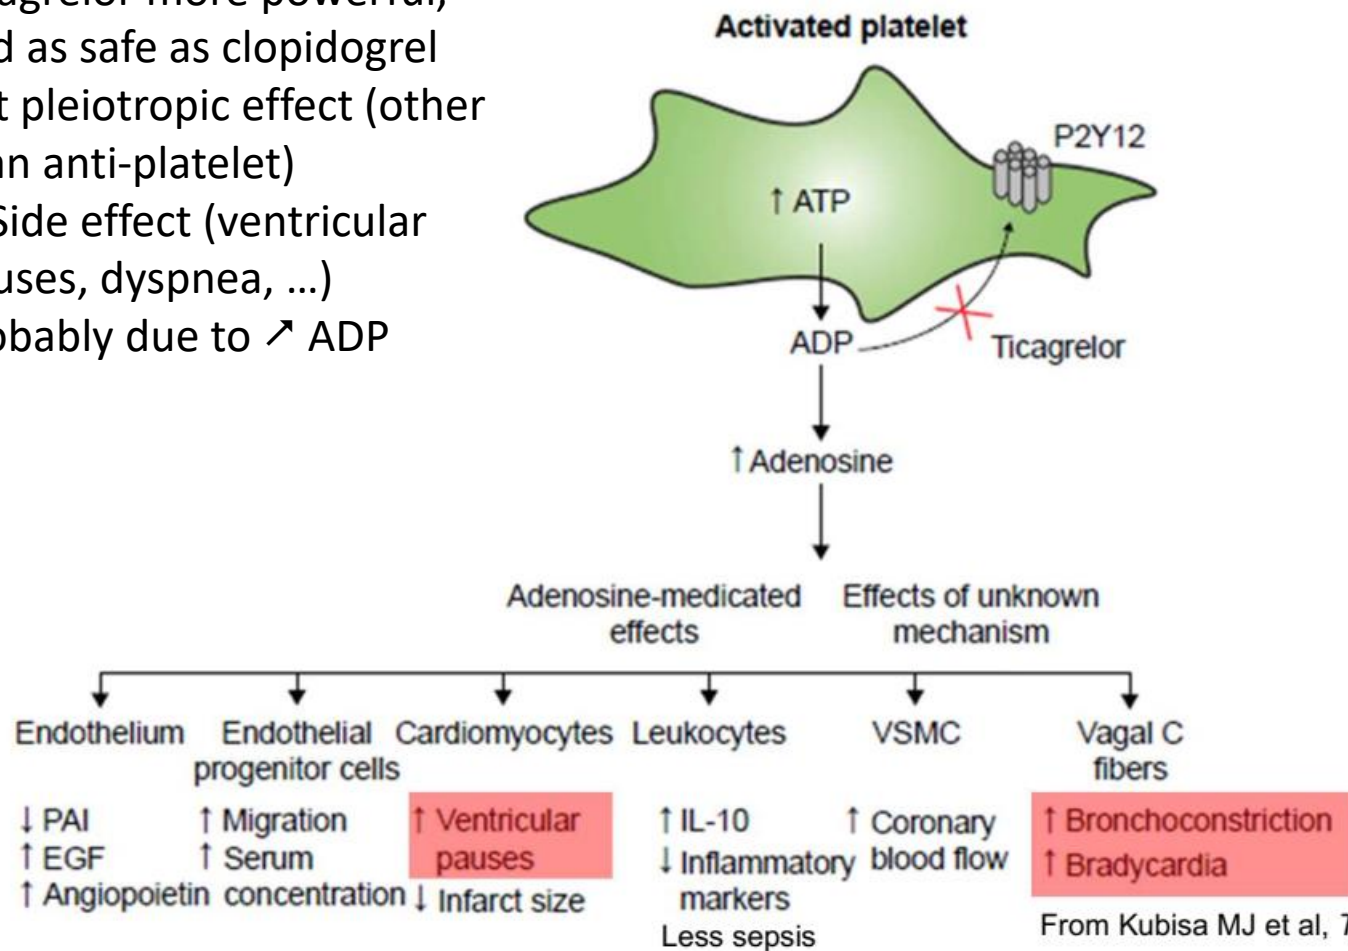

Ticagrelor more powerful,
and as safe as clopidogrel
But...

Antiplatelet drugs

P2Y12 inhibitors (ADP receptor)

Ticagrelor more powerful,
and as safe as clopidogrel
But pleiotropic effect (other
than anti-platelet)
↗ Side effect (ventricular
pauses, dyspnea, ...)
Probably due to ↗ ADP

Antiplatelet drugs

Dual therapy : P2Y12 inhibitors + Aspirin

Different mechanisms of action (one doesn't replace the other) ⇒ Dual therapy to increase the antiplatelet effect through inhibition of 2 distinct pathways

Antiplatelet drugs

Dual therapy : P2Y12 inhibitors + Aspirin

From CAPRIE Steering Committee, *Lancet*, 1996

CAPRIE study

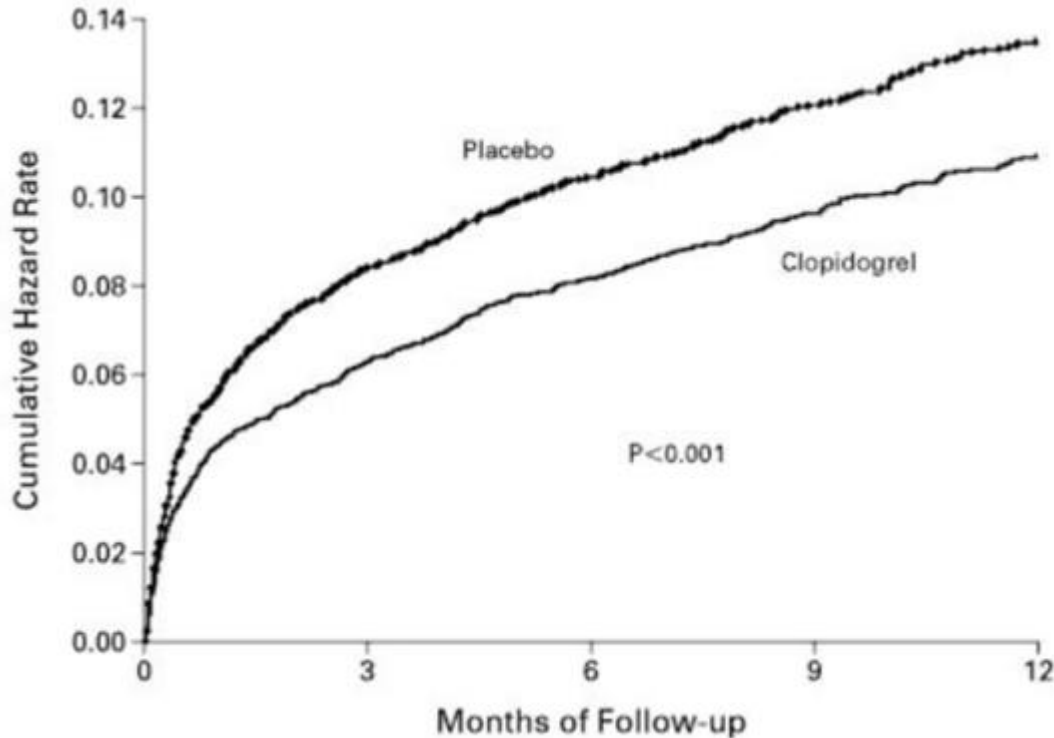

- ~20 000 patients with recent MI, stroke, or PAD
- Treated with clopidogrel or aspirin
- Assessment of major cardiovascular complications under therapy

Both have similar efficacy

Antiplatelet drugs

Ex clopidogrel + Aspirin (Duoplavin®)

Dual therapy : P2Y12 inhibitors + Aspirin

CURE study

- ~10 000 patients with recent arterial thrombosis diagnosis
- Treated with aspirin + placebo or aspirin + clopidogrel
- Assessment of major cardiovascular complications

Dual therapy has higher efficacy

But higher bleeding risk

From Yusuf S et al, *N Engl J Med*, 2001

	Asp + placebo	Asp + Clopidogrel
Cardiovascular events	11,4 %	9,3% (p<0,001)
Major bleedings	2,7 %	3,7 % (p<0,001)

Antiplatelet drugs

Block platelets aggregation (activation)

GPIIb/IIIa inhibitors (fibrinogen binding)

Abciximab (REOPRO®):

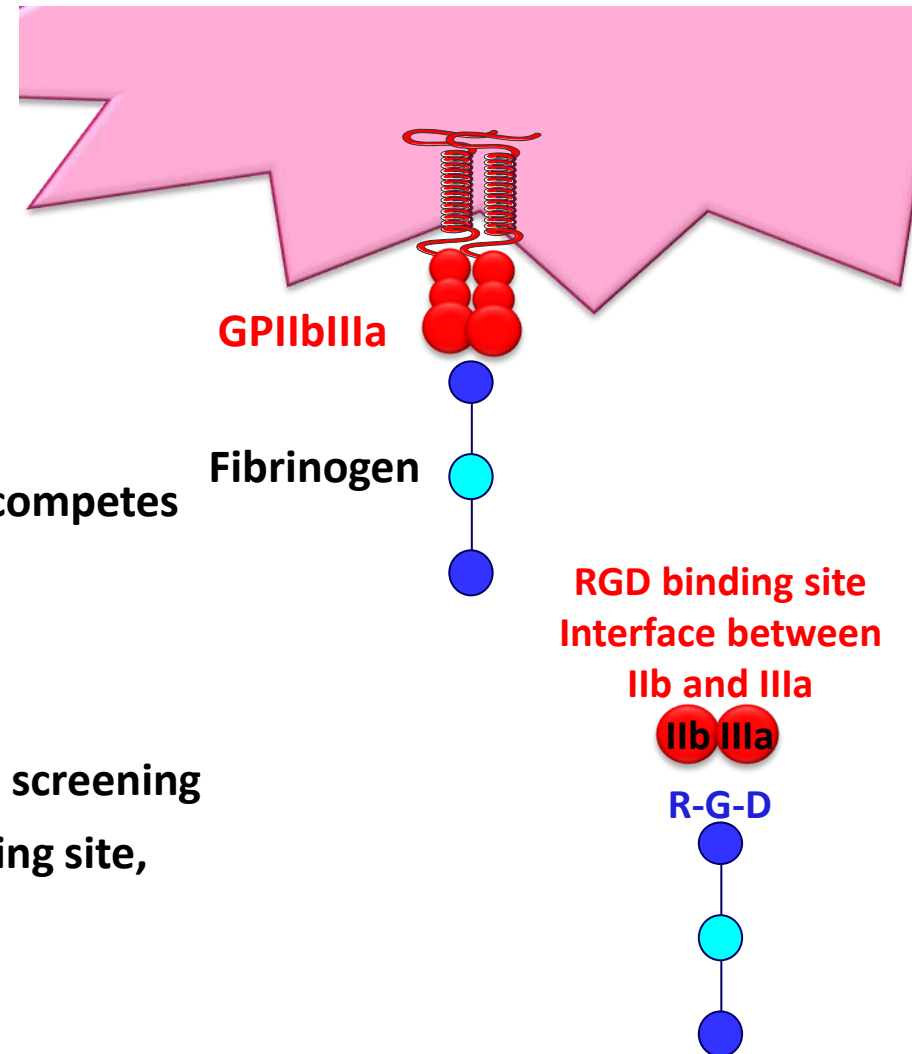

- monoclonal anti-GPIIb/IIIa antibody (hinders RGD binding site)
- Irreversible

Eptifibatide (INTEGRILIN®)

- Peptide derived from rattlesnake venom
- KGD sequence (binds to RGD binding site, competes with fibrinogen)
- Reversible

Tirofiban (AGGRASTAT®)

- Non peptidic molecule identified by virtual screening
- Structure mimicks RGD (binds to RGD binding site, competes with fibrinogen)
- Reversible

Antiplatelet drugs

Block platelets aggregation (activation)

GPIIb/IIIa inhibitors (fibrinogen binding)

IV route only

Adverse effects (thrombocytopenia, bleedings, ...)

Decreasing use (mostly replaced by P2Y12 inhibitors)

Salvage situations in case of massive MI or stent thrombosis during PCI procedure)

Antiplatelet drugs

Indication summary

Indication	Drug
Stable coronary artery diseases	Long term aspirin (clopidogrel in case of allergy)
PCI (following MI)	Aspirin + Prasugrel or Aspirin + Ticagrelor for 1 year and then aspirin long term
PCI in stable coronary artery disease	Aspirin + Clopidogrel for 6-12 months and then aspirin long term
After ischemic stroke	Long term aspirin (clopidogrel in case of allergy)
PAD	Long term aspirin (clopidogrel in case of allergy)
